

Sentinel Hub Presentation

On 16 November, the State Agricultural Intervention Fund hosted the delegation of SINERGISE, the Slovenian company which introduced the cloud web service SENTINEL HUB. These web services use the data produced by Sentinel satellites and the European programme Copernicus in which the SAIF also successfully participates.

Project Sentinel Hub allows to browse, process and analyze large volumes of data from remote sensing and other sources and can be conveniently used in the agricultural sector.

The presentation was attended by 25 participants and was complemented by the data usage sample both for private and public agricultural sector.

The meeting was very successful and gave rise to further discussion on this topic.
